CYBERSECURITY INCIDENT REPORT

1. Background

As a SOC analyst, an incident was reported where a user downloaded a suspicious file after searching for Google Authenticator. Traffic analysis was performed using a provided PCAP file to investigate the infection, identify the affected host, and detect malicious infrastructure.

2. Environment Details

LAN Range: 10.1.17.0/24
Domain: bluemoontuesday.com
Domain Controller: 10.1.17.2 (WIN-GSH54QLW48D)
Gateway: 10.1.17.1

3. Investigation Summary

Network traffic analysis revealed that a Windows host downloaded a malicious executable from a fake Google Authenticator website. Subsequent traffic indicated communication with external command-and-control (C2) infrastructure.

4. Victim Details

IP Address: 10.1.17.215
Hostname: DESKTOP-L8C5GSJ
MAC Address: 00:d0:b7:26:4a:74
User Account: shutchenson
Full Name: Not available in PCAP

5. Findings

The infected system accessed a malicious website impersonating Google Authenticator and downloaded a suspicious executable file. After execution, the system initiated outbound connections consistent with malware behavior.

6. Conclusion

The host was successfully compromised through a social engineering attack involving a fake software download. Further monitoring and remediation actions are required.

7. Recommendations

- Isolate the infected machine
- Reset user credentials
- Perform malware scan
- Block malicious domains/IPs
- Educate users on safe downloads
